In a plasma display panel, first and second switches are coupled in series between a power source  $V_s/2$  and a first terminal of the panel capacitor, and third and fourth switches are coupled in series between the first terminal of the panel capacitor and a power source– $V_s/2$ . A capacitor is coupled between a contact of the first and second switches and a contact of the third and fourth switches, and is charged to voltage  $V_s/2$ . The withstand voltages of the first and second switches are clamped to the voltage  $V_s/2$  while the voltage  $-V_s/2$  is applied to the first terminal of the panel capacitor. Likewise, the withstand voltage of the third and fourth switches are clamped to the voltage  $V_s/2$  while the voltage  $V_s/2$  is applied to the first terminal of the panel capacitor.
